## GET YOUR RADIATION DOSIMETER TODAY

December 14, 2006

Lionel Waxman

It seems like every day we hear of Polonium turning up in some other venue in Europe where those spies who were poisoning each other got a little sloppy. Did you eat some? Did you get it on yourself? Were you just in the same room with it? How near? How long? These are some of the factors you need to calculate to know if you have received a dose that requires attention or not. But you will not have that information available.

The European experience was an unusual occurrence. But if al Qaeda gets to do what it threatens, we may experience radiation events in this country. They may be a small, dirty bombs, in which a conventional explosion scatters radioactive material around. Or they might be full-fledged nuclear explosions, that threaten direct radiation at detonation and fall-out radiation over several days.

Even in a major event, only a small parentage of those people not directly at ground zero will receive lethal doses. Others may receive doses anywhere from serious to trivial. But because the effects are delayed for hours to days, you may not know what your situation is.

I have found a radiation dosimeter that is cheap, reliable and sturdy. It looks like a credit card and it keeps track of your exposure to ionizing radiation for only about \$20 bucks. I recommend it for every person. Just tuck it in your wallet or something else that is always with you and forget it. If an event occurs, it may be the best peace of mind you ever bought.

To order, visit [jplabs.com](http://jplabs.com). That's [jplabs.com](http://jplabs.com).

This is Flashpoint which has no financial interest in this product. I'm Lionel Waxman.
